# Essentials of Qualitative Research

**Winter School in Clinical Research**

**December 2025**

Gerry Hughes

Research Synergies Manager

Wellcome-HRB Clinical Research Facility St James's Hospital

# Qualitative research

- *“Qualitative research is designed to explore the human elements of a given topic, while specific qualitative methods examine how individuals see and experience the world. Qualitative approaches are typically used to explore new phenomena and to capture individuals' thoughts, feelings, or interpretations of meaning and process.”*

# **Is qualitative research suited to my research?**

Absolutely depends on the research question

# Why qualitative research

- Numbers don't explain everything in healthcare
- Example – Flu: Quantitative data tells us:
  - Infection rates
  - Hospital admissions
  - Vaccination coverage
  - But it doesn't explain:
    - Why some patients refuse vaccination
    - Reduced vaccine uptake by healthcare staff

# Features of qualitative research

- Qualitative research studies phenomena in the **natural contexts** of individuals or groups
- Qualitative researchers try to gain a **deeper understanding** of people's experiences, perceptions, behaviour and processes and the meanings they attach to them
- During the research process, researchers use '**emerging design**' to be flexible in adjusting to the context
- Data collection and analysis are **iterative processes** that happen simultaneously as the research progresses

# Forming the research question

<b>PEO</b>	<b>Definition</b>	<b>Example</b>
<b>Population</b>	<b>Who is my question focused on?</b>	<b>mothers</b>
<b>Exposure</b>	<b>What is the issue I'm interested in?</b>	<b>postnatal depression</b>
<b>Outcome</b>	<b>What, in relation to the issue, do I want to examine?</b>	<b>daily living experiences</b>

**Research question:** What are the daily living experiences of mothers with postnatal depression?

# Qualitative Research

If you are asking why something happens, how people feel, or what something means.

# Quantitative Research

If your goal is to measure trends, compare groups, or test a hypothesis.

## Quantitative Research

If your goal is to measure trends, compare groups, or test a hypothesis.

- Typically takes the form of **using instruments to collect numerical data**
- Subject that data to measurement, maybe against a **hypothesis**
- Strict controls for validity and **repeatability**
- **Bias** introduced by the researcher is **minimised/eliminated**
- Experimental research and nonexperimental research, retrospective/prospective research

- Seeking to **understand the meaning**
- Provide a **deeper understanding** of problems
- Researcher **bias is acknowledged** but can't be eliminated
- **Researcher is a lens** through which a reality is reported
- Pure qualitative research, mixed methods

## Qualitative Research

If you are asking why something happens, how people feel, or what something means.

# QUANTITATIVE

Numerical and measurable data

Objective and structured measurement

Large and representative

- How many?
- How much?
- How often?

Surveys, experiments, and closed-ended questionnaires

Statistical tools: averages, percentages, regression, etc.

Generalisable results and predictive insights

## DATA TYPE

## APPROACH

## SAMPLE SIZE

## RESEARCH QUESTIONS

## DATA COLLECTION

## DATA ANALYSIS

## RESULTS

# QUALITATIVE

Descriptive and non-numerical data (words, images, observations)

Subjective understanding and interpretation

Small, purposefully selected

- Why?
- How?
- What does it mean?

Interviews, case studies, open-ended surveys and observations

Thematic or narrative analysis, coding, grounded theory

Deep, contextual understanding and rich detail

# Research Paradigms

**Table 1**

*Ontologies, Epistemologies, and Axiologies of Common Research Paradigms*

<b>Paradigm</b>	<b>Ontology</b>	<b>Epistemology</b>	<b>Axiology</b>
Positivism	<b>Realist:</b> Objective reality exists independently of human perception.	<b>Objective:</b> Knowledge is discovered through empirical observation and measurement.	<b>Value-Free:</b> Research should strive for objectivity and eliminate researcher bias.
Post-Positivism	<b>Nuanced Realist:</b> An objective reality exists, but it can only be imperfectly understood.	<b>Critical and Fallible:</b> Knowledge is theory-laden and subject to revision through empirical testing.	<b>Value-Aware:</b> Complete objectivity is unattainable, and researchers must be reflexive about biases.
Constructivism	<b>Individual Relativist:</b> Reality is subjective, constructed by individuals through personal experiences.	<b>Subjective and Socially Constructed:</b> Knowledge is socially co-constructed by individuals based on their experiences and interactions.	<b>Value-Laden:</b> Values influence knowledge construction. Subjectivity is embraced and reflexivity is encouraged.
Social Constructionism	<b>Social Relativist:</b> Reality is subjective, constructed through collective human interaction and cultural norms.	<b>Subjective and Socially Constructed:</b> Knowledge is constructed through social processes, discourse, and cultural contexts.	<b>Value-Laden:</b> Social factors and power dynamics play a role in shaping knowledge. Subjectivity is embraced and reflexivity is encouraged.

# Qualitative research strategies/approaches

<b>Strategy</b>	<b>Purpose</b>	<b>Example</b>
<b>Phenomenology</b>	Lived experience	Coping with chronic illness
<b>Grounded Theory</b>	Process theory	Patient adherence
<b>Ethnography</b>	Cultural context	ICU team dynamics
<b>Case Study</b>	Bounded system	Palliative care unit
<b>Narrative</b>	Personal stories	Cancer survivor journey

# Qualitative research data collection methods

**Consider  
theory-  
informed data  
collection  
instruments**

- Image credit: <https://www.questionpro.com/blog/qualitative-data-collection-methods/>
- Bourgeault IL, Dingwall R, De Vries RG, editors. The Sage handbook of qualitative methods in health research. Los Angeles: Sage; 2013.

# Sampling

- Usually non-probability sampling strategy
  - **Convenience (opportunistic)** : easy to recruit or are near to the researcher
  - **Purposive**: participants that are best suited to the research question.
  - **Snowball**: initial respondents to a research study are involved in recruiting others
  - **Theoretical**: corroborate or refute theories that are developing
- Sample size, usually much lower than quantitative studies

# Common analyses types

Types of Qualitative Data Analysis	
<b>Thematic analysis</b>	<b>The analysis help identify and interpret occurring trends and themes in data.</b>
<b>Content analysis</b>	<b>Entails arranging data by themes and keywords to see how they relate.</b>
<b>Narrative analysis</b>	<b>Utilized when analyzing word choices and stories from people to understand their experiences.</b>
<b>Discourse analysis</b>	<b>Used to understand participants emotions and sentiments based on situations.</b>
<b>Grounded theory</b>	<b>Involves developing a theory based on individual data.</b>

Image credit: <https://www.expertresearch-dataanalysisihelp.com/NVivo-analysis-services-2702.html>

Raskind IG, Shelton RC, Comeau DL, Cooper HLF, Griffith DM, Kegler MC. A Review of Qualitative Data Analysis Practices in Health Education and Health Behavior Research. *Health Education & Behavior*. 2018;46(1):32-39. doi:[10.1177/1090198118795019](https://doi.org/10.1177/1090198118795019)

# Thematic analysis

*Categorize data into codes  
and engage in an iterative cycle to refine codes*

*Compare and contrast themes*

*Integrate themes into a thematic map and engage in a  
refutation exercise as a cross-check mechanism*

*Crystalize by  
articulating  
meanings and  
patterns of  
meanings that  
produce the  
phenomena using  
metaphors, irony,  
and other tropes*

Stage #1  
Familiarization with data

Stage #2  
Generating initial code

Stage #3  
Searching for themes

Stage #4  
Reviewing themes

Stage #5  
Defining and naming themes

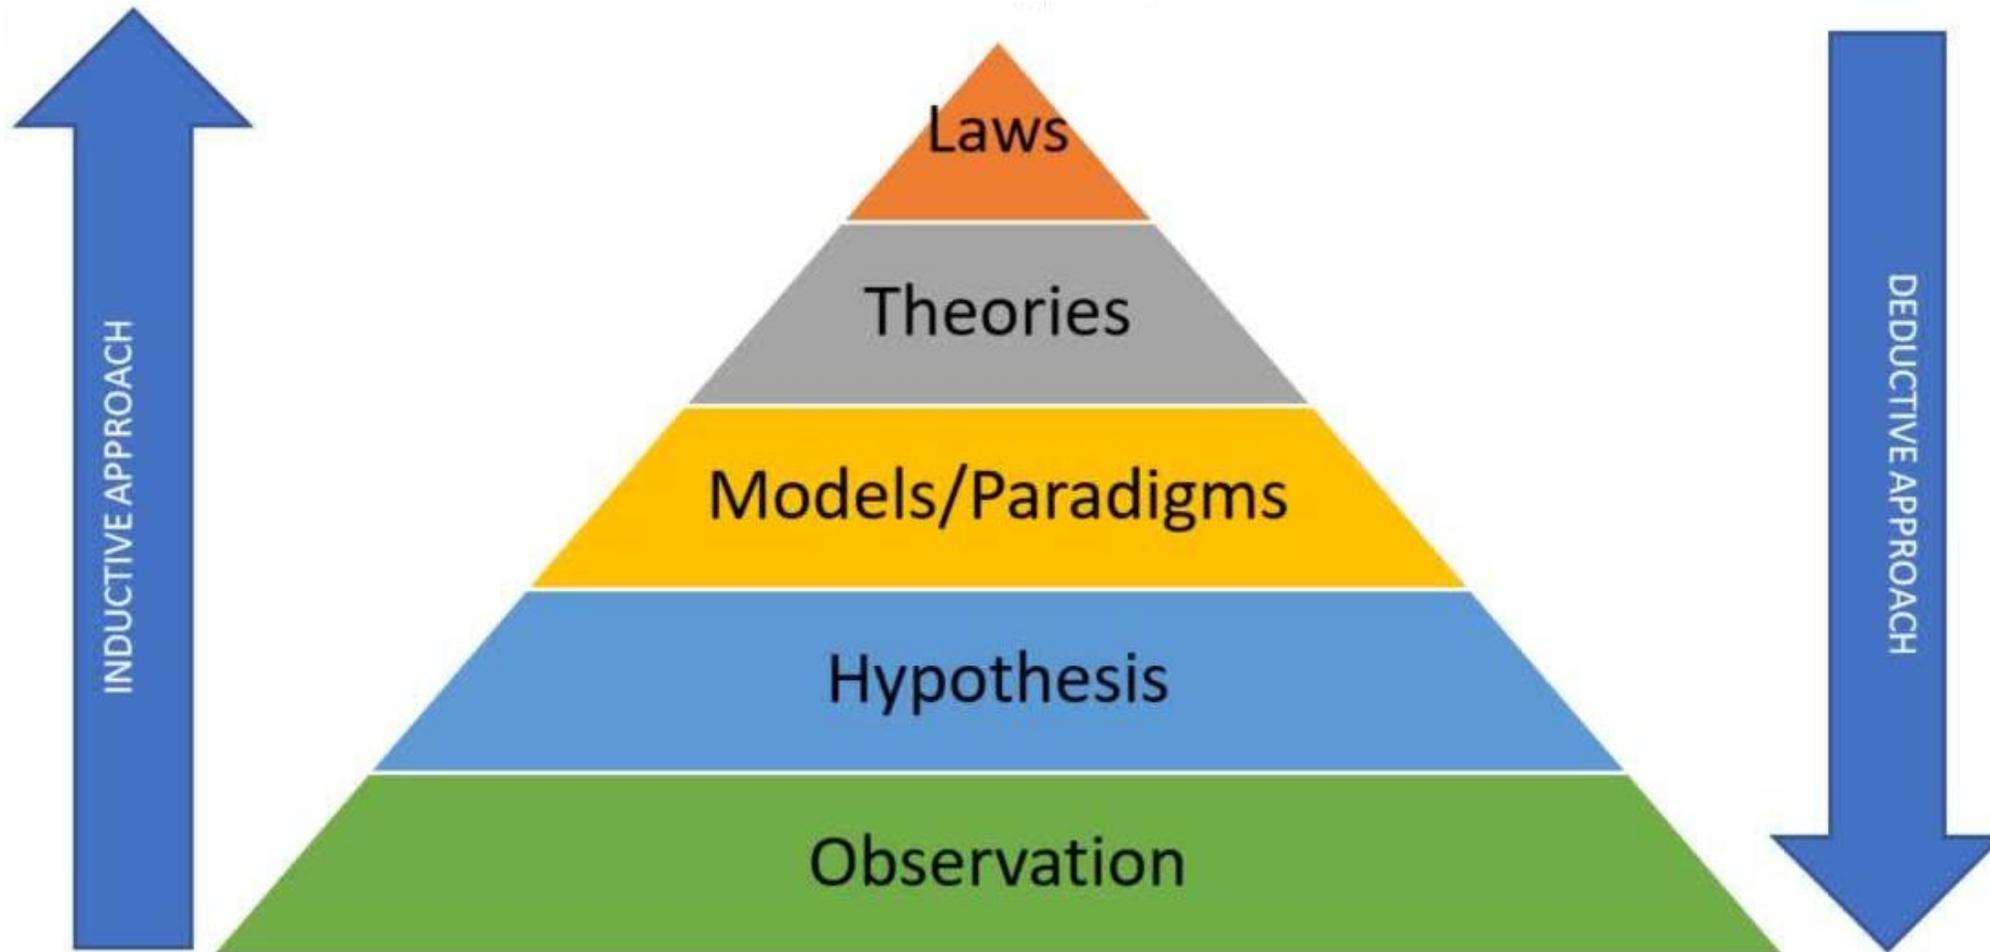

Stage #6  
Reporting themes

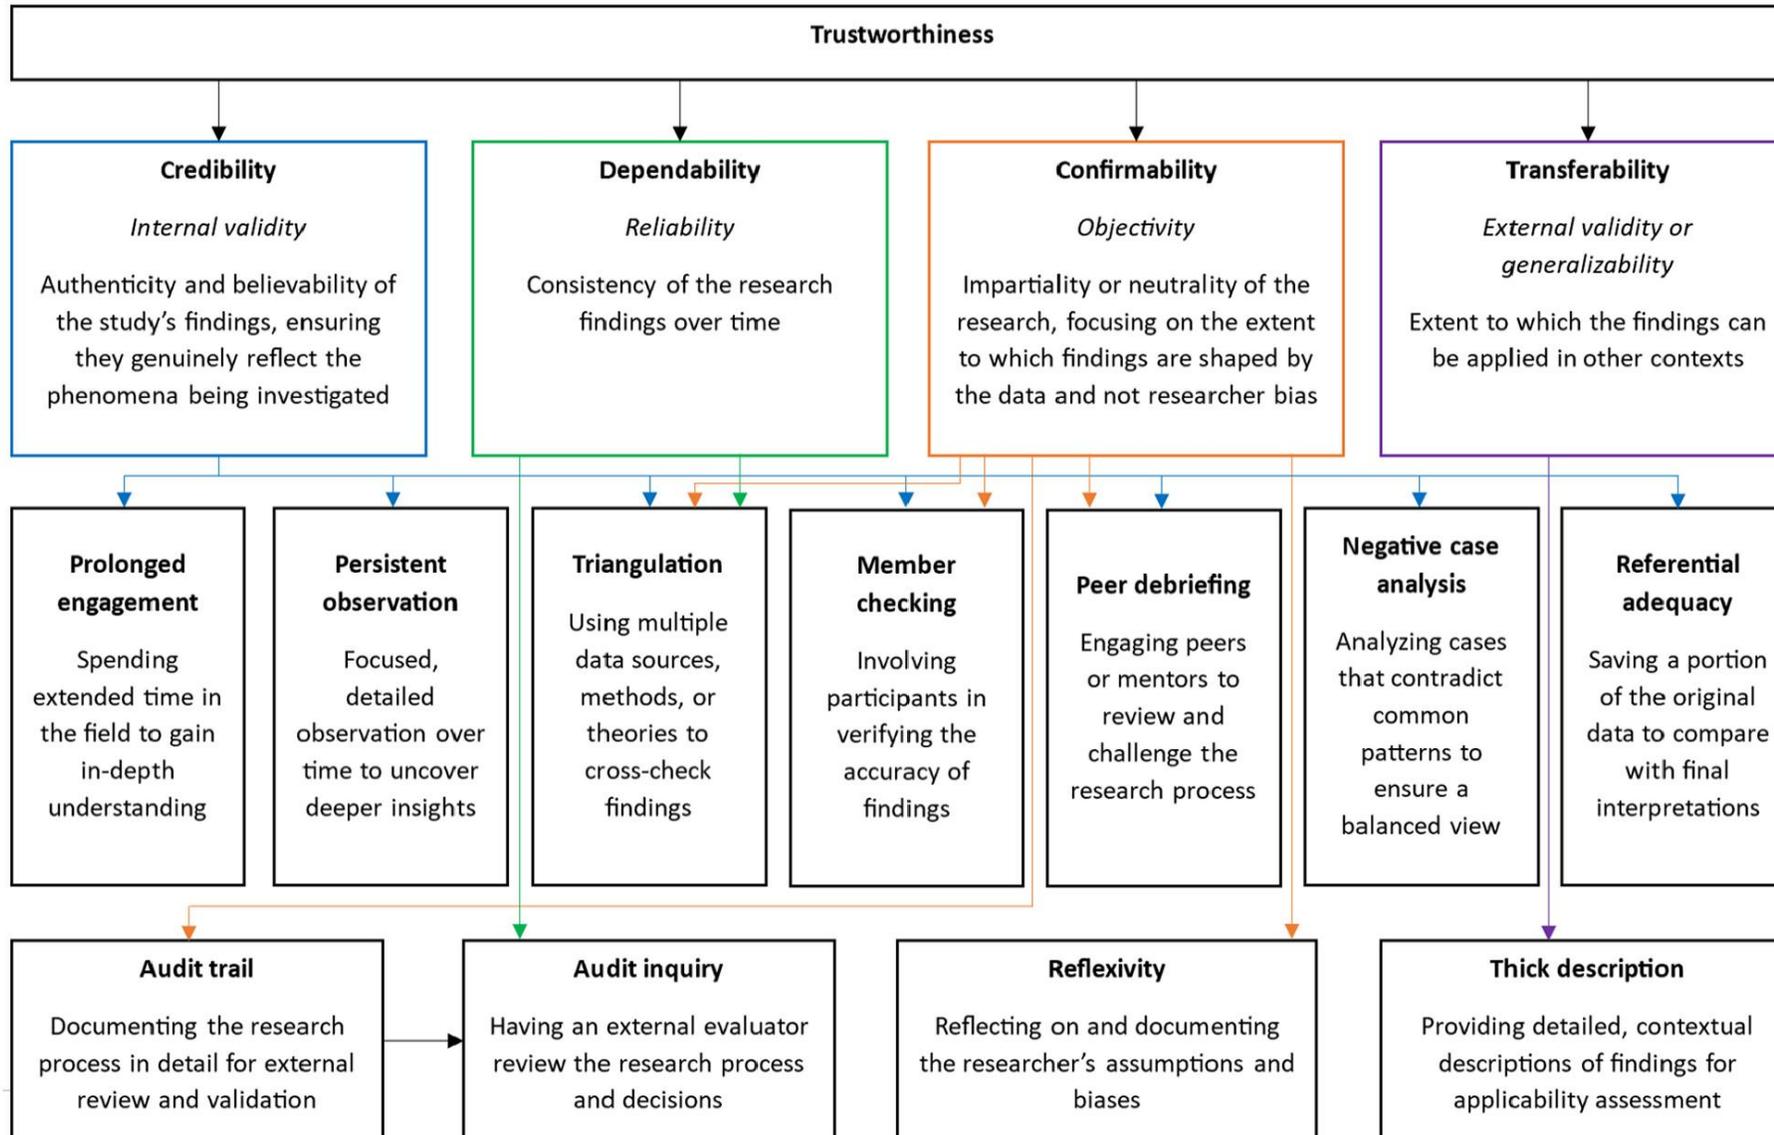

*Engage in abstraction of codes to themes*

*Dimensionalize themes with relevant characteristics*

# Inductive vs Deductive Analysis

# Ensuring rigour in qualitative research

**Saturation refers to the point at which no new data or themes are emerging from the data set, which indicates that the data have been fully explored.**

# The SRQR reporting checklist

For checking that qualitative health research articles can be understood and used by everyone

## Note

If you have not used a reporting guideline before, read about [how and why to use them](#) and check whether SRQR is the [most applicable reporting guideline](#) for your work.

Reporting guidelines are most useful when used early in research. When writing a manuscript or application, consider using the [Full Guidance](#) where you'll see explanations and examples for each item.

After writing, demonstrate adherence by completing this checklist:

1. Specify where each item is described (see [Note 1](#)).
2. Cite this checklist (See [Note 2](#)).
3. Include your completed checklist as a supplement when submitting to a journal so that future readers can use it to find information.

	Item Description	Location (or reason for not reporting)
<b>Title &amp; Abstract</b>		
<b>Title</b>	Describe the nature and topic of the study. Identify the study as qualitative or indicate the approach or data collection methods.	
<b>Abstract</b>	Summarise the key elements of the study using the abstract format of the intended publication.	
<b>Introduction</b>		
<b>Problem Formulation</b>	Describe the problem/phenomenon studied, its significance, relevant theory and empirical work, and gaps in current knowledge.	
<b>Purpose or research question</b>	Describe the purpose of the study and specific objectives or questions.	
<b>Methods</b>		
<b>Qualitative approach and research paradigm</b>	Describe your qualitative approach, your guiding theory (if appropriate), and research paradigm, and reasons for your choices.	
<b>Researcher characteristics and reflexivity</b>	Describe how researchers' characteristics may influence the research, including personal attributes, qualifications/experience, relationship with participants, assumptions, and/or presuppositions;	

<b>Context</b>	Describe the setting/site(s) in which the study was conducted, why it was selected, and any other salient contextual factors that may influence the study.	
<b>Sampling strategy</b>	Describe how and why research participants, documents, or events were selected; criteria for deciding when no further sampling was necessary, and the rationale for those criteria.	
<b>Ethical issues pertaining to human subjects</b>	Describe any approval by an appropriate ethics review board and participant consent, or explain any lack thereof. Describe any other confidentiality and data security issues.	
<b>Data collection methods</b>	Describe the types of data collected; details of data collection procedures including (as appropriate) start and stop dates of data collection and analysis, iterative process, triangulation of sources/methods, and modification of procedures in response to evolving study findings. Describe your rationale for these choices.	
<b>Data collection instruments and technologies</b>	Describe any instruments (e.g., interview guides, questionnaires) and devices (e.g., audio recorders) used for data collection; describe if/how the instrument(s) changed over the course of the study.	
<b>Units of study</b>	Describe the number and relevant characteristics of participants, documents, or events included in the study. Describe the level of participation.	

	participants, documents, or events included in the study. Describe the level of participation.	
<b>Data processing</b>	Describe the methods for processing data prior to and during analysis, including transcription, data entry, data management and security, verification of data integrity, data coding, and anonymisation / deidentification of excerpts.	
<b>Data analysis</b>	Describe the process by which inferences, themes, etc. were identified and developed, including the researchers involved in data analysis; usually references a specific paradigm or approach. Describe why you chose this process.	
<b>Techniques to enhance trustworthiness</b>	Describe any techniques to enhance trustworthiness and credibility of data analysis,(e.g., member checking, triangulation, audit trail). Describe why you chose these techniques.	
<b>Results</b>		
<b>Synthesis and interpretation</b>	Describe the main findings (e.g., interpretations, inferences, and themes); might include development of a theory or model, or integration with prior	

Links to empirical data	Provide evidence (e.g., quotes, field notes, text excerpts, photographs) to substantiate analytic findings.	
<b>Discussion</b>		
Integration with prior work, implications, transferability, and contribution(s) to the field	Summarize the main findings, explain how findings and conclusions connect to, support, elaborate on, or challenge conclusions of earlier scholarship; discuss the scope of application/generalizability; identify unique contribution(s) to scholarship in a discipline or field.	
Limitations	Discuss the trustworthiness and limitations of findings	
<b>Other</b>		
Conflicts of interest	Describe any potential sources of influence or perceived influence on study conduct and conclusions. Describe how these were managed.	
Funding	Describe sources of funding and other support. Describe the role of funders in data collection, interpretation, and reporting.

# Examples of Qualitative Research

## *Design, setting, and participants*

We conducted a prospective, qualitative study at St. James's Hospital (SJH) a large, public inner-city tertiary-care referral center in Dublin, Ireland. The SJH AMS program was established in 2001 through a partnership between the departments of Infectious Disease, Clinical Microbiology, and pharmacy. It was not formally funded but was supported by the appointment of a single pharmacist via the Strategy for the Control of Antimicrobial Resistance in Ireland.<sup>14</sup> Prospective audit and feedback was initiated on ward areas; educational programs were developed; and clinical audits were undertaken to monitor prescribing patterns. In 2015, the SJH AMS program underwent strategic, operational, and governance restructuring to reflect best practice in undertaking AMS in acute-care settings.<sup>15</sup> Although the AMS team previously reported to the hospital pharmacy and therapeutics committee, it switched to hospital board reporting through the quality, safety, and improvement division. A new multidisciplinary strategic and oversight committee was formed with stakeholders from all relevant professions (including non-infection-related specialities) and executive management across the hospital.

~~The study was conducted between June 2019 and May 2020.~~

Electronic and paper posters were distributed throughout the hospital to advertise the study. Clinicians across medical, surgical, nursing, and pharmacy professions were purposively recruited from the hospital clinician population to gain broad insight from key stakeholders relevant to the research aim. High-volume prescribers were not specifically recruited. Informed consent was obtained from each participant.

# Examples of Qualitative Research

## *Data collection*

Focus groups and semistructured interviews were used to collect data and were hosted by a trained facilitator. A literature search informed the interview schedule, which was refined through consensus with the research team. It was subsequently amended iteratively, where deemed necessary, after each focus group or interview.<sup>16</sup> Examples of unbiased discussion questions and follow-up questions are outlined in the Supplementary Materials (interview schedule).

To minimize the potential for power differentials among clinicians, each focus group consisted of homogenous professional groups.<sup>17</sup> Participants were given the option to review their own transcriptions. A pilot focus group with 5 residents was conducted, and results were included in the final data set. No incentives were offered for participation.

The study was approved by the SJH Institutional Review Board and the SJH Research Ethics Committee.

## *Data management and analysis*

Focus groups and interviews were audio-recorded and transcribed verbatim. Reflective notes that contributed to data analysis were also recorded by the primary investigator (G.H.). Transcriptions were completed and coded by 1 investigator (G.H.) and were reviewed by 2 additional investigators (A.O.L. and C.B.) for consistency of coded data. Data were analyzed inductively, through thematic analysis,<sup>19</sup> to construct themes.

# Examples of Qualitative Research

Theme	Illustrative Quotation
Antimicrobial consumption perceived as a proxy measure for antimicrobial prescribing quality	<p>“I suppose the things that we would be broadly interested in is obviously volume of prescriptions.”—Attending surgeon</p> <p>“It means, if there is a buy-in of less IV antibiotics, everyone and their mother will look it (feedback) all up and do everything and hound this doc and that doc. If it means less IVs and preparing IVs and giving IVs . . .”—Clinical nurse manager</p>
Lack of connection between antimicrobial prescribing and patient outcomes	<p>“Just what’s relevant to us . . . I want MY report . . .”—Attending physician</p> <p>“And from a stewardship point of view, different wards that are more inclined to use . . . antibiotics that we wouldn’t necessarily associate with being first line so . . .”—Medical resident</p> <p>“Why did we spend that much? Oh, because there were 7 patients on the ward and were incredibly sick. I think it (feedback) would have to be externally provided but internally checked.”—Attending surgeon</p>
Relevance and impact of antimicrobial prescribing feedback associated with professional role	<p>“It (feedback) should be available for everybody that wants to access it. Well, I think! Why would it not be?” Clinical nurse specialist.</p> <p>“ . . . It will change your daily practice once you’ve kinda like, once, em, you can kind of reflect on it.”—Medical resident</p> <p>“We can keep hounding attendings and sure, we’re at nothing.”—Clinical nurse manager</p> <p>“I think sometimes, as well, when you don’t have senior decision makers on the ward rounds . . . There are no decisions made. And may not be made for 5 days!”—Clinical nurse manager</p> <p>“ . . . The (medication administration) timings, and then that’s a nursing perspective that we can govern.”—Clinical nurse manager</p> <p>“ . . . A resistant organism would be a reason for prescribing something that you wouldn’t normally prescribe for that indication.”—Medical resident</p> <p>“But looking at the number of people in the hospital who have . . . an antibiotic allergy, and then looking up what they’re on . . .”—Attending physician</p>

# Mixed Methods

<https://doi.org/10.1038/s44259-025-00146-8>

## **A mixed methods evaluation of an antimicrobial prescribing clinical decision support system app**

 Check for updates

**William J. Waldock**<sup>1</sup> <sup>✉</sup>, **Mark Gilchrist**<sup>1,2</sup>, **Hutan Ashrafian**<sup>1</sup>, **Ara Darzi**<sup>1,3</sup> & **Bryony Dean Franklin**<sup>2,3,4</sup>

This study evaluated how the usability and accessibility of a digital antimicrobial prescribing app influences clinical decision-making. Using a convergent parallel mixed methods design, the study assessed app usage patterns with surveys and interviews to identify common barriers. Among 700 users at a tertiary hospital, 61 completed the survey (7.3% response rate), including 52 prescribers. Additionally, 20 prescribers participated in interviews. While 87% found the guidelines relevant, only 52% rated navigation as easy, and 34% reported slower decision-making compared to other clinical decision support systems (CDSS). App use peaked during morning rounds (8–11 AM). Key challenges included navigation inefficiencies (59%), technical barriers, limited onboarding, and concerns around clinical AI transparency. Interviews highlighted frustration with excessive steps and a desire for simpler guideline access. Findings highlight the need for user-friendly CDSS tools integrated into clinical workflows, and stress the importance of stakeholder co-design to improve medication safety.

# TRIAL FORGE STUDIES WITHIN A TRIAL (SWAT) CENTRE

Randomised controlled trials are the fairest tests for healthcare treatments, and aim to improve the health and wellbeing of people worldwide. However, there is very little evidence about how to design, deliver and report these trials.

*A Study Within A Trial (SWAT) is a methodological study which aims to generate new knowledge to improve the design and delivery of future trials.*

- **The EJGP Collection on Practical Guidance to Qualitative Research**
  - <https://www.tandfonline.com/journals/igen20/collections/practical-guidance-to-qualitative-research>

The screenshot shows the website interface for the European Journal of General Practice. At the top, there is a dark blue navigation bar with the journal's name and a search bar. Below the navigation bar, there are four main menu items: 'Submit an article', 'About this journal', 'Browse all articles & issues', and 'Follow this journal'. The main content area features a sidebar on the left with links to 'Journal homepage', 'Current issue', 'List of issues', 'Special issues', 'Collections', and 'Most read articles'. The main content area displays the title 'The EJGP Collection on Practical Guidance to Qualitative Research' in large, bold black text. Below the title, it indicates the collection was created on 24 Nov 2021 and updated on 14 Nov 2023, with 7 articles. A blue 'Share' button is located to the right of the article count. The main text describes the collection's purpose: to provide novice qualitative researchers with practical guidance for conducting high-quality qualitative research in primary care. It mentions that 'novice' includes Master's students, PhD students, and junior researchers, as well as experienced quantitative researchers who are engaging in qualitative research for the first time. The series addresses their 'frequently asked questions' and provides references to criteria and tools for judging the quality of papers reporting on qualitative research.

## The EJGP Collection on Practical Guidance to Qualitative Research

Created 24 Nov 2021 | Updated 14 Nov 2023 | [7 articles](#)

The EJGP series on qualitative research methods intends to provide novice qualitative researchers with practical guidance for conducting high-quality qualitative research in primary care. By 'novice', we mean Master's students, PhD students and junior researchers, as well as experienced quantitative researchers who are engaging in qualitative research for the first time. The series addresses their 'frequently asked questions'. The series provides researchers, readers, reviewers and editors with references to criteria and tools for judging the quality of papers reporting on qualitative research.
